

The Digital Shower

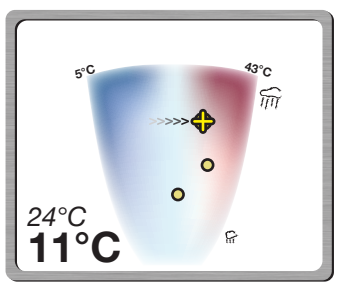

A better showering experience at your fingertips!

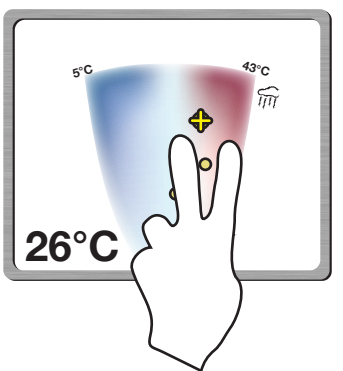

The Digital Shower is a new shower interface based on a touch screen, allowing the user to directly visualize and control the temperature and intensity of the water.

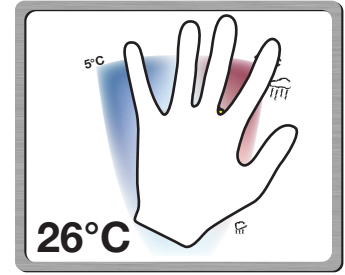

A single finger press on the water space, and the shower will promptly deliver the desired water. Here, the user selected one of the preset points, which are automatically determined by past showering experiences.

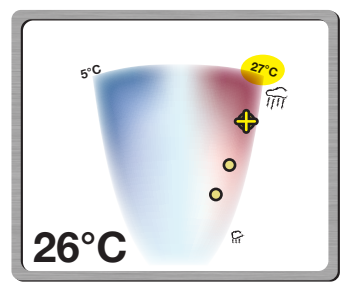

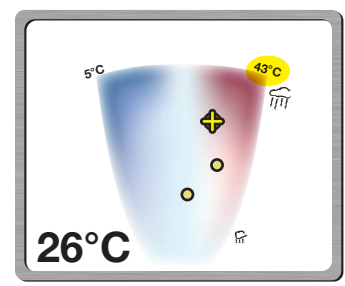

While configuring the desired water, the system displays useful information such as the current and wanted water temperatures.

With two fingers on the screen, the user can refine the temperature by scrolling left or right, and the intensity by scrolling up or down.

A hand press simply stops the water. Another hand press restarts it. Useful for lathering or shampooing.

With WaterControl™, the user gets the same showering experience, regardless of the initial water temperatures. Less setting, more enjoyment.

And more!

- sensitive waterproof screen that works even with lather,
- no mechanical part, no rust, no calcium deposit,
- available in degree Fahrenheit.
