

here's a **bright** idea...

Problem:

- Many cars alert drivers to turn headlights **OFF**
- However, some do not alert them to turn them **ON** when driving at night
- As a result, drivers may forget to turn on their headlights, thus potentially putting themselves in danger

Solution:

- Provide a backlit button on the steering wheel
- Light emitted from the button will not be perceptible during day; however, it will be most noticeable when it is dark
- When button is pushed, it will no longer be illuminated, and headlights will be turned on
