Telephonic Entry Systems

Problem

The interactions provided by the A - Z buttons coupled with the single line display make precise searching difficult

Single-line Display
> Forces user to scroll through the directory more slowly in order to find a person

A - Z Buttons
> Allows user to scroll through the directory in two modes:
> 1. One - by - one
> 2. Fast Scrolling

Solution

Enhanced search controls and directory display afford greater search capabilities
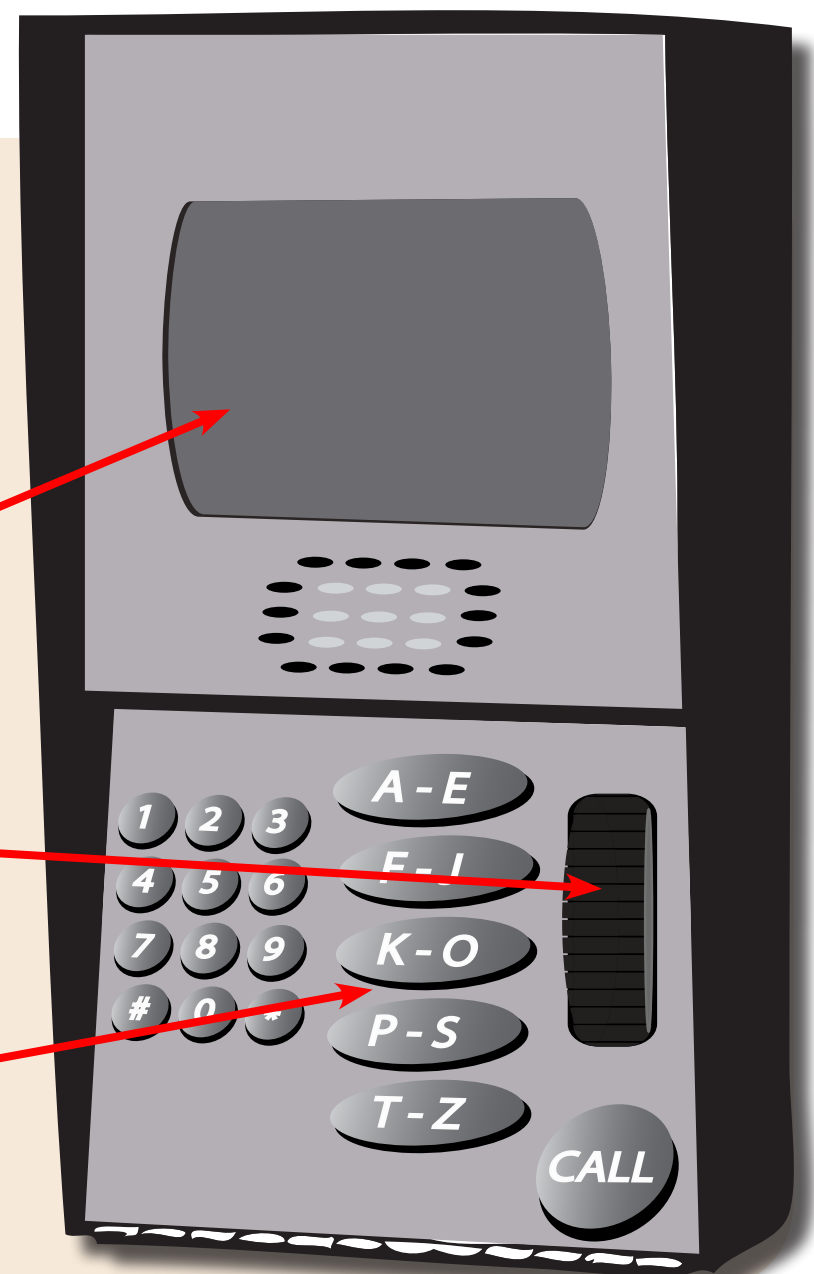

Multi-line Display
Allows user to see where they are in the directory thus allowing for better adjustment of scroll speed

Scroll Wheel
Provides user with more control over scroll speed and allows for quick adjustment

Alpha-Range Buttons
Allows user to quickly jump to a section in the directory
